The product is DraftMate AI — Legal Drafting Studio.

Its target users include:

- Advocates and legal professionals.
- Law students.
- Legal researchers.
- Professionals who regularly draft or review legal documents.

The problem is that legal work involves multiple disconnected activities:

1. Reading reference documents.
2. Researching relevant legal authorities.
3. Drafting legal documents.
4. Editing and formatting drafts.
5. Checking citations.
6. Reviewing contracts and identifying risks.
7. Repeating similar work across different documents.

DraftMate AI aims to bring these workflows into one intelligent workspace.

Our product vision

Imagine a lawyer uploading an existing agreement and saying:

“Review this agreement, identify risky clauses, verify the legal references, and prepare a revised draft using the formatting and writing style of my previous agreement. Explain every substantial change.”

The system should then:

1. Read the uploaded documents.
2. Understand the requested task.
3. Select the appropriate legal skill.
4. Retrieve relevant reference materials.
5. Generate the draft or review.
6. Check legal citations against accessible sources.
7. Display the changes and supporting evidence.
8. Accept further instructions through text or voice.
9. Export the final document.

2. Understand the Six Core Systems

The problem statement can be translated into six major technical systems.

System	What it does	Priority
1. AI Drafting Engine	Generates and revises legal documents	Critical
2. Legal Skills Framework	Executes specialised legal workflows	Critical
3. Document Intelligence	Extracts and processes uploaded files	Critical
4. Citation Verification	Checks legal references and supporting authorities	Critical
5. Reference-Style Adaptation	Uses reference documents to match writing style and structure	High
6. Voice Agent	Converts spoken instructions into actionable tasks	High

Context and token optimisation, professional interface design, and document export should support these systems.

We should not implement six independent AI features.

Instead, we should build **one orchestrated system with specialised components**.

For example, the contract-review skill should use the document-processing system, AI drafting engine, legal research capabilities, and citation verifier.

This makes the product more coherent, easier to demonstrate, and easier to extend.

This is where I would spend the most strategic thought.

A hackathon team has limited time. If we attempt to build a complete legal platform with dozens of skills, every feature risks becoming superficial.

Instead, we should build one excellent workflow and use it to demonstrate the underlying architecture.

Flagship feature: AI Contract Review and Redrafting

The user uploads:

- An existing agreement.
- An optional reference agreement.
- Optional supporting legal materials.

The user selects:

Contract Review → Identify Risks → Verify Citations → Generate Revised Draft

The application then produces four outputs.

A. Contract analysis

Example:

Clause	Finding	Severity
Payment terms	Payment deadline is not clearly specified	Medium
Termination	Termination conditions may be ambiguous	High
Liability	Liability allocation requires review	High
Confidentiality	Duration of obligations is unclear	Medium

These are illustrative findings, not actual legal conclusions.

The system must derive its findings from the uploaded contract and clearly distinguish observations from assumptions.

B. Risk explanations

For every finding, the system should explain:

- What the original clause says.
- Why it may be problematic.

- What information is missing.
- What change could address the issue.
- Whether supporting legal authority was found.

C. Revised contract

The system generates a revised draft while preserving the original document's intended meaning unless the user requests a substantive change.

Every material change should be traceable to a user instruction or an identified issue.

D. Verification report

The system separates:

- Verified references.
- Partially verified references.
- Unverified references.
- Claims for which supporting authority could not be found.

The verification module should provide supporting source links when available and avoid inventing legal authorities.

Why this workflow is strong

It demonstrates multiple product capabilities in one session.

Capability	Demonstrated?
Document upload	Yes
Document understanding	Yes
Specialised legal skill	Yes
AI drafting	Yes
Reference-style adaptation	Yes, with a reference agreement
Legal research	Yes, where relevant sources are accessible
Citation verification	Yes
Change analysis	Yes

DOCX/PDF export	Yes
Voice commands	Yes, as an additional interaction mode
